

The Cruithne Accord

1. Earth and Mars, with their respective natural satellite systems and space within these systems out to their L2 points, are entitled to 1400 and 606 W/m² respectively (99% of natural solar output as measured June 2136) or enough augmented solar input necessary to keep their climate within the standard parameters of the 2120-2136 period, whichever is the largest. The spectral characteristic of the solar radiation is not to deviate markedly from a stellar blackbody spectrum. Other regions of the solar system are left open to exploitation.
2. All polities outside the Dyson sphere are entitled to a hemispherical 4K sky entropy sink and no more entropy influx than the June 2136 standard sun.
3. The resources of the Earth and Mars systems are left under control of their local polities (the NEO Adhoc and UN of Earth, MTN of Mars) or successor polities to these.
4. The Mars system polity is acknowledged as owner of current MTN mining outposts, the bodies they are located on and masses in transit from and to these, as well as an additional 1e23 kg of mass from as yet unallocated mass.
5. The Earth system is acknowledged as owner of current mining outposts based on Earth or NEO economies, the bodies they are located on and masses in transit from and to these, as well as an additional 1e23 kg of mass from as yet unallocated mass.
6. The Dyson community is acknowledged as owner of currently designated Dyson or Trophe-Posthuman habitats and systems, the bodies they are located on and masses in transit from and to these.
7. Unallocated mass and energy beyond these accords are to be distributed by a first-come-first-served basis according to the Revised Outer Space Treaty of 2104.
8. The use of autonomously self-replicating non-citizen systems that can survive in free space is prohibited.
9. If a conflict about these resources, the proper division of a multiply colonised body or the proper interpretation of these accords occurs, all parties defer to the reconvention of the Cruithne Summit or delegate authority.

Note: The Cruithne Accord process delegated a body allocation court to settle the issues related to the Jupiter moons, Juno and WK3934. The body allocation court formally remains in service for the future located at Cruithne.

Signatories

Melissa Meloria, Dyson Core Entelechy (representing 455 Structured Interests and ratified by Main Cluster policy future market to p=1e-13)

Fredrik Hendrich Kefke, Maria Gonzales Riviera Cardaz, Leo Feng-Yodrowski, Demarchs of the NEO Adhoc

Chief Project Administrator Liu Than, Martian Terraforming Network

Chairman-General Ali Loftus Hendrix of the United Nations
